MONITORING FOR
GOVERNMENT SECURITY

Integrated Technologies For Safe, Secure Facilities

WHY CHOOSE ASP?

Our scalable solutions for intrusion detection systems (IDS) and deterrence provide encrypted, versatile, high-level physical security with secure communications to keep personnel informed in times of emergency and help ensure a rapid, informed response.

Acadiana Security Plus is an approved federal government contractor, with a Commercial and Government Entity (CAGE) code from the United States Department of Defense's Defense Logistics Agency. We have the resources to handle high-volume and complex requirements, while also maintaining the highest standards for quality and accuracy to best serve military and government facilities.

Secure Network Monitoring of Alarm Signals

The DMP control panel used for high-security and UL2050 SCIF applications incorporates the U.S. government's approved Advanced Encryption Standard (AES) Rijndael Encryption and has received the industry's first UL Listing for Highline Security with NIST-approved 128-bit or 256-bit encryption.

Secure Systems, Easy Operation

To make system operation simple and effective, we use innovations like the DMP Prox Patch which attaches to a cell phone or wallet or other portable device and turns it into an access control wand, allowing access to authorized users identified by the patch. Prox Patch software includes options for credential verification and anti-passback control.

Flexibility In Schedules

Our system panels have enhanced scheduling for areas, doors, outputs, and holiday schedules to offer enhanced flexibility. Ninety-nine programmable schedules are available and can be assigned to an area, door, or output. The same schedule may be assigned to more than one area, door, or output, making them reusable.

- ⊘ **Up to 8 schedules per profile**
- ⊘ **Up to 8 schedules per area**
- ⊘ **Up to 8 schedules per door**
- ⊘ **Up to 8 schedules per output**
- ⊘ **Up to 40 holiday dates**

TRUE CARD + CODE ENTRY WITH INTEGRATION FEATURES

We meet DCID 6/9 for ID card access that requires a card read plus a manual code entry to uniquely identify each system user. DMP systems can be programmed for access and security functions in one step by initiating authorization, door activation, and security disarming with a single credential and code number. Scheduling offers options for control based on personnel requirements, time of day, day of week, and more. Our high security keypad's randomizing keypad display changes sequence every time the keypad requests a code entry, and a privacy filter turns the screen black from side viewing angles. These two features make it virtually impossible to steal user codes by shoulder surfing or surveillance.

SYSTEM SCALABILITY ENSURES LASTING VALUE OF YOUR SECURITY INVESTMENT

Our panels and user interfaces can be scaled to fit your security needs, cost-effectively. We provide ongoing service and flash programming upgrades to ensure that systems have the latest software. Panel hardware has similar flexibility. For example, we've added functions to our security alarm panels so access control, fire, and intrusion are operable via a single interface. This saves you the cost of swapping out entire panels or purchasing additional single-function panels to gain improved integrated functionality.

In addition, commercial off-the-shelf (COTS) systems' open architecture is designed for third-party integration, giving you the flexibility to expand your current system or allow for future growth. Add CCTV and video applications, detection devices, and environmental and process control systems, as needed, to avoid lapses in security.

REPORTING FEATURES PAY OFF IN ADDED SAFETY, SECURITY, AND ACCOUNTABILITY

Thanks to System Link™ software, your integrated system can automatically report facility opening/closing times, staff arrival times, sensor activation times, and patrol check-in times. Systems alert duty personnel with visual and auditory signals designed for redundancy, descriptive accuracy, and critical feedback about security status.
