

VIDEO VERIFICATION & MONITORING

Protect your business with real-time notifications, alerts and anytime, anywhere access to video clips and live video streams.

Video Verification

Video verification goes a step beyond the traditional burglar alarm panel, integrating with existing closed-circuit TV to access key video at your facility. When an alarm is triggered, the video information or recording is delivered to central station during the event. The local operator becomes a “remote eyewitness” and can evaluate what is actually happening on site in order to improve police response to deliver greater security.

- **Faster emergency response**

The best security is typically equated to fast police response in the event of a problem. What you may not realize is that law enforcement call centers prioritize calls and because video verifications are considered “in progress,” they are a higher priority than traditional alarms.

- **Reduced costly false alarms**

Authorities are only dispatched when truly necessary, eliminating costly fines for false alarms.

- **Increased apprehension of suspect(s)**

With faster response times, intruders are more likely to be apprehended on site, and video can be used in identification and prosecution of criminals.

Video Event Monitoring

(or Interactive Video Monitoring)

Acadiana Security Plus extends security surveillance capability with video automatic incident detection.

- **Automatic guidelines and situations create an ‘event’**

Video event monitoring is guided by parameters set by the customer, like: detecting a person in general, or someone in an unauthorized area after hours, object counting, or even when an object leaves an area of interest.

- **Immediate review and response**

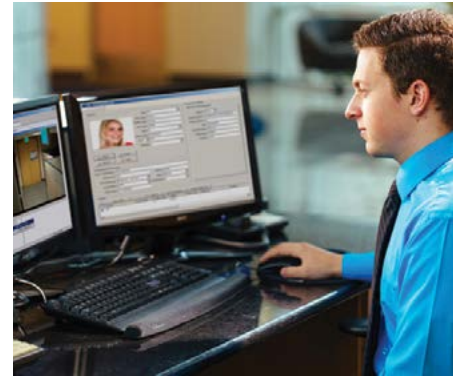

When a video analytic rule has been violated, an alarm is immediately sent to ASP’s video response center, along with a short video of the event. Our analysts review the video and determine the actions to be taken, based on protocols provided by the customer. This can include notifying the police or an on-site guard, triggering a relay, and even using two-way audio to make an announcement.

- **Enhanced security for large and unmanned facilities**

This feature is particularly helpful in securing areas like gated communities, outdoor storage unit areas, farms, sports venues, schools, warehouses, shopping centers and more.

eCare Alerts

Often when customers install a video monitoring system they don’t think about that system ever failing. These failures happen without notice and most often are not detected until you need to access video from your system. By then, it’s too late.

- **Consistent device monitoring**

Using Immix Video Monitoring software, eCare verifies that our device is online. At any time that it is offline, it will raise an alarm to notify the video response center at ASP.

- **Prompt customer notification**

Protocols will then be followed to ensure that the customer is aware of the issue with their device. When connection is restored to the device, a restore alarm will notify ASP that the device is back online.

- **Resolution upon request**

At your discretion, we can dispatch an ASP service technician to resolve the problem.

Health Status Monitoring

The health or “functionality” of your video monitoring system is the heart of your security, and an unexpected issue could result in loss of your video at a time when you might need it most.

- **Continual system monitoring.**

ASP constantly monitors the overall functionality of your video monitoring system and will know as soon as an issue occurs.

- **Immediate analysis and resolution.**

ASP’s video analytics can evaluate and determine if a site visit is required or if the problem can be resolved remotely.

- **Common problems detected**

- Connection and network issues
- Camera failures and tampering
- Hard disk failures
- Recording issues
- Video loss
